Kyrene Middle School

Prepared for:

Kyrene School District No. 28

VOLUME II OF III

**FM GROUP INC
FM Project 08-145**

June 2008

1.0 SURVEY RESULTS AND RECOMMENDATIONS

1.1 Summary

At the authorization of Kyrene School District No. 28 (KSD), FM GROUP INC (FM), has conducted a Comprehensive Asbestos Hazard Emergency Response Act (AHERA)-Compliant Asbestos Inspection for the seven buildings comprising the Kyrene Middle Elementary School (KMS) campus. This inspection was intended to provide information regarding the presence, location and condition of identified Asbestos-Containing Building Materials (ACBM) at the subject facility.

The field portion of the inspection was performed at the subject facility during the period of May 5, 2008 through May 8, 2008. A total of 154 bulk-material samples were collected from 424 suspect ACBM located within the facility. Sampling was conducted in general accordance with the protocols set forth in the Environmental Protection Agency (EPA) AHERA Regulation 40 CFR 763.86. Samples were delivered to Fiberquant Analytical Services (FAS) for analysis by the Polarized Light Microscopy (PLM) methodology.

Three Hundred Seventy-two building materials within the inspected facility have been analytically identified or assumed to be asbestos-containing. The identified ACBM were physically assessed to be non-friable and in good condition.

1.2 Identified Asbestos Containing Building Material

The identified ACBM within the seven buildings at KMS are presented in tabular form (Table C) in Section 1.3. These tables are organized to show material code, general material description, material locations, laboratory analysis, friability and material quantities. Additionally, ACBM location plans that graphically identify the known extent of these materials by floor plan locations are presented in Section 1.4.

1.3 Asbestos-Containing Building Materials

(Table "C" has been moved to Section 6 of the Management Plan.)

1.4 ACBM/Location Plans

(Drawings have been moved to Section 6 of the Management Plan.)

1.5 Critical Situations

Critical situations are those areas in which the condition of existing ACBM are such as they represent an immediate danger to human health and the environment. **There were NO critical situations observed in the seven buildings at KMS during this inspection.**

1.6 Friable Asbestos-Containing Building Materials

A friable material is one that when dry can be crumbled, pulverized, or reduced to powder by hand pressure. **There were NO friable Asbestos-Containing Miscellaneous or Surfacing Building Materials, or Asbestos-Containing Thermal System Insulation in the seven buildings at KMS during this inspection.**

1.7 Material Assessments

Due to the fact that **NO friable Asbestos-Containing Miscellaneous or Surfacing Building Materials, or Asbestos-Containing Thermal System Insulation** were identified in the seven buildings at KMS, **NO** formal assessments are included in this report.

1.8 Recommendations

There are ACBM that have the potential to become damaged during future Operations and Maintenance (O&M) and renovation activities. FM, therefore, recommends that a Management Plan following EPA and Occupational Safety and Health Administration (OSHA) guidelines be developed to address the in-place management of the identified ACBM. In accordance with EPA regulations, a Management Plan must be developed by an EPA Accredited Management Planner.

1.9 Qualifications of Report

FM has endeavored to investigate the existing conditions within the subject facility using that degree of care and skill ordinarily exercised under similar circumstances by asbestos consultants practicing in this, or similar localities. The information contained in this Report is relevant to the dates of FM's site work, and should not be relied on to represent conditions at a substantially later date.

This Report has been prepared on behalf of and exclusively for the use of KSD. This Report and the findings contained herein shall not, in whole or in part, be disseminated or conveyed to any other party or be used or relied upon by any other party, in whole or in part, without FM's prior written consent.

2.0 PROJECT INFORMATION

2.1 Background

KSD intends to determine if there are any ACBM associated with the seven buildings at the KMS campus. Based on the presumed age of the subject facility, it is likely that ACBM's were included in its construction. In compliance with EPA requirements, specifically its AHERA mandated inspections (40 CFR 763.85), KSD has contracted FM to perform a Comprehensive AHERA Compliant-Asbestos Inspection of the seven buildings at the subject facility.

FM was formally engaged by KSD through the acceptance of FM's correspondence for Fee Revision, dated January 16, 2008, as evidenced by the issuance of KSD Purchase Order No. 808792, dated February 8, 2008. The project was coordinated for KSD by Mr. Giacomo Musella, Facilities Supervisor.

The subject facility is located at 1050 East Carver Road, in Tempe, Arizona and consists of seven buildings. The subject facility was occupied and operational at the time of the inspection with access provided by KSD personnel. This inspection was comprehensive by design, including interior and exterior building components and exterior mechanical systems associated with the seven buildings.

At the request of KSD, select identified suspect ACM were sampled, and remaining suspect materials were assumed to be asbestos-containing. No previous asbestos inspections were available for review.

The inspection was performed during the period of May 5, 2008 through May 8, 2008, by Michael Richter and Dane Thompson, both of whom are EPA accredited Building Inspectors. Bulk-material samples were delivered to FAS for analysis by the PLM methodology. FAS is accredited under the American Industrial Hygiene Association's (AIHA) National Institute of Standards and Technology (NIST) National Voluntary Laboratory Accreditation Program (NVLAP).

2.2 Description of Construction

2.2.1 Buildings E, F, G, H, J, K and L

The construction date of Buildings E, F, G, H, J, K and L is unknown. The construction appears to be consistent and uniform throughout each building.

The buildings are built with slab on-grade foundations. Perimeter and interior load bearing walls are of concrete masonry systems and wood or metal-framed construction, and support a concrete deck system finished with asphalt prepared roofing systems.

Floor finishes observed include: carpet, ceramic mosaic tile, unfinished concrete and vinyl composition tile.

Original walls are concrete masonry systems and wood or metal-framed, gypsum wallboard systems with textured, painted finishes, fiberglass reinforced panel, glazed wall tile, stucco, tackable wall panels or wallpaper. Restroom walls are finished with gypsum wallboard systems with textured, painted finishes and glazed wall tiles. Original ceilings are wood or metal-framed and support gypsum wallboard systems with textured, painted finishes and suspended ceiling systems.

Fire doors were observed to be associated with exterior entrances into the buildings, corridors and miscellaneous interior rooms.

Mechanical equipment for the buildings consists of roof-mounted mechanical units. The ductwork distribution systems run above the gypsum wallboard and suspended ceiling systems and are routed into the individual rooms through ceiling or wall-mounted supply registers.

2.3 AHERA Inspection Procedures and Protocols

2.3.1 Inspection Procedures and Protocols

The EPA's AHERA inspection procedures and sampling protocols as called-out in the AHERA Regulations (40 CFR Part 763) requires that all Asbestos-Containing Materials (ACM) utilized within the structure of a regulated "school" building which are called ACBM:

- be identified and located
- be classified as an assumed ACBM or,
- be sampled and analyzed to prove they are NOT ACBM
- be assessed for;
 - ◊ natural friability and,
 - ◊ physical condition and,
 - ◊ if damaged or thermal systems insulation;
 - * be identified for an immediate response action or,
 - * be identified for possible future disturbance and
 - * have preventative measures to reduce potential damage identified.
- have all the forgoing activities conducted and recorded in such a manner as to be able to track;
 - ◊ date accomplished and,
 - ◊ identification and qualification of individuals conducting each activity.

2.3.2 FM GROUP INC Inspection SOP

FM's inspection procedures and protocols have been developed into a logical step by step process designated to accomplish both EPA's AHERA and OSHA's mandates. During inspections, FM will always endeavor to identify all ACM in a structure, whether ACBM or not, so as to limit the possibilities of accidental exposure to contractors or employees during future maintenance or remodeling activities.

2.4 Visual Inspection

A visual inspection of the seven buildings was conducted to locate and identify Homogeneous Areas (HA) of suspect ACBM. A HA is defined as an area in which the suspect material appears to be uniform in texture, color, and wear and believed to have been applied during the same general time period. All materials excluding wood; glass; metal; fibrous glass, glass foam and rubber thermal insulation were considered suspect.

2.5 Physical Assessments

A physical assessment of each identified HA of suspect ACBM was conducted to determine what, if any, damage the area has sustained and to determine whether the material should be classified as either friable or non-friable.

The EPA defines a friable material to be one which, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. Based on this definition of friability, FM ascertained if a material was friable by physically touching each material surface.

At the time of this inspection, **TWENTY-ONE** friable suspect ACBM (acoustical ceiling panels, duct seam tape and spray-applied fireproofing) were observed. Since **NONE** of these materials were analytically identified or assumed to contain asbestos, **NO** formal assessments are included in this report.

2.6 Sample Collection

Convenience sampling was performed on select identified suspect ACBM, except for the spray-applied fireproofing, which was random sampled. Destructive sampling activities to access materials within ceiling, floor or wall systems were not utilized. Inspection personnel performing sampling activities utilized proper personnel protection. Additionally, inspection procedures included the use of engineering controls to minimize the release of airborne fibers during sample collection.

Based on FM's sampling strategy, the following number of bulk-material samples was collected from observed suspect ACBM.

Building	Suspect ACBM	Samples Collected
E	60 (54 Assumed)	16*
F	62 (56 Assumed)	18
G	60 (53 Assumed)	21
H	60 (53 Assumed)	21
J	54 (45 Assumed)	27
K	46 (39 Assumed)	21
L	82 (72 Assumed)	30
TOTAL	424	154

*Multiple samples collected from select materials.

2.7 Bulk-Material Sample Analysis

Upon completion of the on-site portion of the work, bulk-material samples accompanied by a Chain-of-Custody form were delivered to FAS for analysis. Samples were analyzed using PLM coupled with dispersion staining as detailed in the EPA's "Interim Method for the Determination of Asbestos Material Insulation Samples" (EPA-66/M4-82-020, December 1982).

PLM is the EPA recommended method for bulk sample analysis and utilizes the unique optical and crystallographic properties of the various constituents of the sample for material identification purposes. These properties, refractive indices, birefringence, sign of elongation, and extinction angle, are characteristically unique to each asbestos form and were used to identify asbestos types present in the samples. Under existing EPA guidelines, the identification of asbestos-form minerals in a single bulk-material sample is sufficient to classify that material as an ACM. On the other hand, a *minimum* of three samples must be identified as not containing asbestos-form minerals to classify that material as non-ACM. All samples of a specific suspect ACM were analyzed until the first sample containing an asbestos-form mineral was found.

END OF REPORT

PREAMBLE

An Asbestos Operations and Maintenance (O&M) Program depends on several factors to be successful. Management involved with either contracted or in-house renovation/maintenance projects at this facility will constantly be posed the question "Does this material contain asbestos?". The O&M Program ideally includes the resources for all employees or contractors to contact the appropriate person for information about specific materials, which they may impact. District or outside personnel with knowledge of Asbestos-Containing Materials (ACM) or Asbestos-Containing Building Materials (ACBM) in this facility should always be involved in the initial planning phase of maintenance, remodel, renovation, and demolition projects.

A successful O&M Program must include written procedures and policies, which are respected and followed by employees and contractors. There will always be some problems because some employees and contractors simply do not care about policies and procedures and they just want to complete their work. The District needs to prepare for the inevitable cleanup and abatement following impact to ACM or ACBM by employees, or natural building system failures such as water leaks. The District should always have abatement consultants and contractors available to provide support when it is needed.

A reliable consultant is needed to help in managing in-place asbestos at a facility. The consultant can serve as a valuable resource by conducting material testing, air monitoring, work inspection, and management services.

A reliable abatement contractor will be needed to conduct small and large abatement projects associated with normal building maintenance and renovation projects. This will help in addressing estimating issues for projects and emergency responses. The contractor must be available for emergency situations and they must have a good understanding of the requirements for working at the facility. Most facilities have various levels of occupant concern and it is often necessary to take extra precautionary measures when abatement work is conducted in specific areas or buildings. An abatement contractor who conducts many projects at a facility will have a good understanding of the kind of conduct that is expected, the level of required cleanup, and specific abatement work practices.

A complete O&M Program with policies and procedures will not work if the employees are not adequately trained about what they should and should not do when they work around ACM or ACBM. An O&M Program is successful only if all employees work together to avoid situations where ACM or ACBM are impacted and fiber releases occur.

ASBESTOS MANAGEMENT POLICY STATEMENT

Kyrene School District No. 28 (KSD) shall endeavor to minimize asbestos risks to their students, their employees, and the public through proper management of ACBM in District-owned and District-controlled facilities.

Proper management includes good O&M practices, enclosure, encapsulation, and removal of ACBM as mandated and, where appropriate, as prioritized by the Kyrene Middle School (KMS) Asbestos Management Plan.

Each facility shall adopt an O&M Program as part of its Asbestos Management Plan. Each O&M Program must be consistent with the KMS's Asbestos Management Plan, and all rules and codes that apply to that facility's operation.

Each facility's O&M Program is a management tool to be followed until all ACBM is removed from that facility. O&M Programs are designed to:

- Cleanup and repair any existing contamination from past damage or disturbance until such time as the ACBM can be removed,
- Prevent further release of asbestos fibers through good work practices, and
- Maintain asbestos in good condition through an ongoing program of monitoring the condition of ACBM and repairing any damage.

Each facility owning or controlling structures containing ACBM shall coordinate and monitor all asbestos-related activities. KSD has a designated person to ensure that the policies and procedures of each KSD facility's O&M Program is followed. This person is called the "Asbestos Program Manager" (APM). The APM, with assistance from the District's Asbestos Consultant, shall develop and implement O&M Programs that comply with all relevant federal, state, and local laws.

EXECUTIVE SUMMARY

This O&M Program Manual for the KMS Campus at 1050 East Carver Road in Tempe, Arizona, is a part of KMS's Asbestos Management Plan. Its purpose is to help assure well-reasoned control of ACBM in this facility.

The mandated goals of KMS's program include:

- Information documenting the presence or absence of ACBM,
- Standards for managing ACBM,
- Action to correct any immediate health hazards,
- Standards to inform and train employees, and
- Long-term commitment by KMS to manage ACBM.

I. O&M PROGRAM POLICIES AND PROCEDURES

1.0 INTRODUCTION

Asbestos Today

At one time there were over 3,600 commercial products that contained varying amounts of asbestos. The Federal Environmental Protection Agency (EPA) and Occupational Safety and Health Administration (OSHA) estimate that over 2,000 of the 3,600 asbestos-containing products were used in a variety of building materials.

Asbestos-containing sprayed-on insulation and acoustical materials and thermal system insulation were banned in the 1970s.

The first three steps to manage ACBM in a facility are:

- Identifying and determining the extent of the problem,
- Performing a hazard assessment on each material to determine the potential for asbestos fiber release, and
- Developing a plan to deal with the ACBM in each facility. This plan is the Asbestos Management Plan.

Once these three steps are taken, there are five options to deal with the ACBM. They include good O&M practices, repair, encapsulation, enclosure, and removal. While removal of asbestos from facilities is the only permanent option, and may be required at some point of building use (see 40 CFR 61, Subpart M, 11/20/90), it is not always the most economic option, which may protect human health and the environment. It should also be noted that any control option other than removal will result in the need for an O&M Program to maintain the ACBM which is left in the building.

2.0 DESCRIPTION OF AN O&M PROGRAM

An O&M Program is a set of policies, procedures and work practices that are intended to minimize occupant exposure to airborne asbestos fibers. The O&M Program is designed to protect workers and other building occupants who work around ACBM. An effective O&M Program will provide guidance for protection by (1) cleaning-up and repairing any existing contamination from past damage and disturbances, (2) preventing further release of asbestos fibers through good work practices, and (3) maintaining asbestos in good condition through an effective program of monitoring the condition of ACBM and repairing any damage.

All effective O&M Programs have common elements that include:

- A Policy Statement
- Training Requirements
- Employee Protection
- Medical Surveillance
- Labeling and Notification
- ACBM Surveillance
- Disposal of ACBM
- Exposure Monitoring
- Work Permit System
- Record Keeping
- Specialized Cleaning
- Emergency Response Procedures
- Maintenance Work Practices

Technical assistance to develop a complete plan may be needed from building staff, maintenance and custodial personnel, and other journeymen who may work at the facility. Architects, engineers, consultants, contractors, medical advisors, and legal counsel can also be good resources to assist in developing the O&M Program.

An O&M Program, to be useful and understandable, must be site specific for each individual building. It should address *specifically*: O&M cleaning, repair and maintenance in areas of ACBM within the building. For instance, it should not be a general statement on worker protection, but should be an ACBM specific statement on work practices and policies.

Needless to say, the O&M Program must be based on a complete and comprehensive building inspection designed to identify *all* the ACBM in a building. Only with this important prerequisite in place, will an O&M Program be successful in avoiding the potential health effects to people and resulting liability to the building owner.

The O&M Program Manual should include a summary of any existing asbestos survey information. It should include the types of material found to contain asbestos and the areas where they are found. Schematic floor plan drawings can be very helpful in this section.

2.1 Personnel Responsibilities

The success of the O&M Program depends on the active involvement and understanding of all parties. This may range from KSD administrator to the manager of the asbestos program and the school staff. Each school must ensure all asbestos-related activities are done in compliance with relevant federal, state, and local laws. In order to do this, KSD has designated a person (known as the APM) to carry out relevant laws and the policies/procedures of this O&M Program Manual.

In addition, KSD may provide support staff, including a response team, to assist the APM in carrying out his/her responsibilities. Below is a list of job responsibilities assigned to key personnel in developing and implementing the O&M Program.

2.1.1 Asbestos Program Manager

The APM, or designee, develops and implements the asbestos control program. The appropriate responsibilities include the following:

- Manage the O&M Program; document, update, and announce its activities.
- Maintain and manage the documented inventory of ACBM in its present locations.

- Participate in the development, review, and monitoring of program designs, and/or repair and alteration projects. Comply with relevant standards and laws when disturbing ACBM.
- Implement the asbestos training program(s). Participate in the development and implementation of a medical surveillance and respiratory protection programs.
- Ensure asbestos programs are documented and record-keeping activities comply with relevant laws and this O&M Program Manual.
- Seek technical direction and assistance from a qualified asbestos consultant. This may be for the program development and implementation, inspection and reinspection of ACBM, and/or personnel training.

2.1.2 Response Team Leader

- Keep an inventory of equipment and supplies.
- Check warning labels and replace them as needed.
- Coordinate and report work and emergency practices.
- Assist the APM, or designee, with his/her duties.

2.1.3 Response Team

- Conduct small-scale, short-duration asbestos removal activities.
- Conduct initial and periodic cleaning activities.
- Respond to fiber release episodes.
- Conduct or help conduct periodic surveillance activities.
- Assist the APM, or designee, and response team leader with record-keeping duties.

2.1.4 Consultation Staff

- Assist in development and implementation of O&M Program.
- Enhance the District's Asbestos Management Program through consultation.

2.2 Basic Considerations for Selecting Asbestos Abatement Contractors

Successful asbestos abatement projects demand a high level of expertise, experience, and specialized knowledge from all members of the "abatement team". As the principal "hands-on" member of the abatement team, the abatement contractor carries a large burden in fulfilling contractual obligations requiring him to successfully abate a particular asbestos hazard. This enormous responsibility, as well as an understanding of the potential consequences of an

unsuccessful project, requires a building owner to exercise his best efforts to ensure a successful completion.

A key step in the management of asbestos abatement projects of any kind is selecting the best person or company to perform a particular project. The scope, complexity, magnitude, and other particularities of any abatement project must be matched to potential contractors' abilities to successfully complete the job. Qualification of potential contractors is considered by many industry leaders to be one of the best methods to help ensure successful completion and to avoid common construction pitfalls that tend to be magnified in the highly charge atmosphere of asbestos abatement.

While no system of prequalification is foolproof, there are a number of key questions that should be asked in virtually all cases. The following are offered as some basic points of consideration when prequalifying asbestos abatement contractors; they are by no means all-inclusive.

- How long has the company been in business?
- How long has the company been actively involved in asbestos abatement contracting?
- Has the company previously done business under other corporate names? Is so, what were they, and where were they incorporated?
- What projects have the company completed that are similar in size, scope and complexity to your particular project?
- What is the abatement experience of key company personnel, such as site superintendents and project managers?
- What are the educational and asbestos-specific training qualifications of key company personnel?
- Was the training of key personnel performed through in-house training programs, private training providers, or others?
- Is the company properly licenses to perform asbestos abatement work in your project's jurisdiction?
- Does the company, either under its present or past names, have any past or present regulatory citations? If so, what was the disposition of any past citations or what is the status of pending cases?
- Is asbestos abatement work covered by the Company's commercial general liability or supplementary insurance policy(s)?
- Is the insurance coverage of the occurrence, claims-made, or other form? If the policy is through a risk retention group, what is the financial status of the group and its history of paying claims?
- Is the company's bonding capability sufficient for the size of your particular project?

- Does the company have a reasonably good credit history? Does the company show an out-of-the-ordinary number of liens against it on previous projects?

3.0 TRAINING

A written plan is vital to provide step-by-step procedures and to document the intent at each facility. To implement and carry out a successful program, a well-designed training program is needed.

Training provides an awareness of the presence of ACBM, types of ACBM, consequences of disturbing ACBM, and proper work practices to minimize release of fibers. Also, training can inform personnel of existing management goals in dealing with ACBM and proper procedures in the event of an emergency.

3.1 Training Levels

A review of the three training levels which should be required for O&M Programs is provided below:

General Awareness Training

All custodial and maintenance personnel who work in a building containing ACBM should have at least two hours of asbestos awareness training, regardless of whether they intend to disturb ACBM or not. This training extends to temporary employees. All new maintenance personnel should receive training within 60 days of employment. Training topics include types and uses of asbestos, health effects of exposure, location of ACBM in each building in which they may work, how to recognize damage/deterioration of ACBM, the name and telephone number of the APM, or designee, and the availability and location of the facility's Asbestos Inspection Report. This training may be done by the APM, or designee.

Small-Scale Asbestos Worker Training

Employees who conduct any activity which may result in the disturbance of ACBM should complete an approved 16-hour training course. Topics should include the two-hour general awareness, personal protective equipment, work practices, personal hygiene, safety hazards, medical monitoring, air monitoring, regulations, hands-on training and a review. A review examination of the training may be useful as a tool to encourage study and understanding of the subjects covered.

The training for each individual should be documented as to date, location, and length of training. This documentation should be preserved in permanent files, and new employees should be trained prior to working with ACBM.

Asbestos Program Manager Training

APM's are to receive training in the health effects of asbestos exposure, detection, identification and assessment of ACBM, options for controlling ACBM, asbestos management programs, and relevant federal, state, and local laws.

It is also recommended that the APM receive training as an EPA Accredited Building Inspector, Management Planner, Contractor/Supervisor, and Project Designer.

3.2 Record Keeping

All training must be documented. Records of all training should be kept for an indefinite period of time.

Training records/forms are kept for each person who receives any asbestos-related training. A list of training records to be kept by each facility is presented below:

- Each employee receiving the two-hour General Awareness Training completes the *General Awareness Training Form*, or equivalent form.
- Each employee who completes the 16-hour training fills out a *Small-Scale Worker Training Form*, or equivalent form.
- Regardless of the training taken, the APM, or designee, completes and signs an *Asbestos Management Coordinator Training Form*, or equivalent form.
- Also, each facility should require proof of proper training for all outside contractors who handle asbestos in their building.

Asbestos Hazard Emergency Response Act (AHERA) training requirements are discussed in the EPA Regulation 40 CFR 763.84 and 763.92. All facilities covered by AHERA should review this regulation to comply with training requirements.

4.0 EMPLOYEE PROTECTION

Each facility should develop and implement an employee protection plan to ensure safe work practices for employees handling ACBM.

4.1 Respiratory Protection

Respiratory protection is required by OSHA (29 CFR 1926.1101) when air contamination levels exceed or may exceed the permissible exposure limit (PEL) as defined below:

- PEL includes the 8-hour time-weighted average (TWA) limit and the excursion limit (EL)
 - ◊ PEL is defined as 0.1 f/cc averaged over 8 hours
 - ◊ EL is defined as 1.0 f/cc averaged over 30 minutes

It is not always possible to know the exact employee exposure until after an O&M or small-scale project is done. Therefore, during initial cleaning and other O&M projects, workers are provided at least half-face, negative-pressure, air-purifying respirators. A higher level of respiratory protection may be needed for some projects. This will be decided on a case-by-case basis.

These OSHA exposure levels are compliance triggers only and have no reference to "safe" levels of exposure, nor were they intended to. They are meant only to be levels which could be easily quantified or measured and therefore, demonstrated in a court of law if need be, to enforce a variety of mandated compliance issues.

To better protect workers from exposure and protect building owners and employers from liability, the stated intent of good Respirator Protection Programs (RPP) should be to protect workers to *at least* a maximum level of exposure calculated to be 0.01 f/cc. The US EPA AHERA regulation requires that schools document a "final clearance" air sampling of less than 0.01 f/cc by Phase Contrast Microscopy (PCM) analytical methodology before an asbestos abatement work area may be reoccupied by unprotected building occupants.

Each facility should implement the KSD's written RPP to comply with relevant federal, state, and local laws.

The following OSHA regulations are mandatory as they apply to respirator use in asbestos O&M Programs:

- 29 CFR 1910.134
- 29 CFR 1926.1101
- 29 CFR 1926.1101
- 29 CFR 1926.1101 Appendix C
- 29 CFR 1926.1101 Appendix D

4.2 Personal Protective Equipment

In addition to respirators, each facility should provide and, under most conditions, should require the use of Personal Protective Equipment (PPE) such as protective coveralls, rubber boots, and gloves. Each facility also provides and requires the use of eye protection as needed. If the facility does not use disposable, single-use coveralls, they must abide by regulatory requirements for laundering contaminated clothing. These requirements include, but are not limited to, laundering clothing in such a manner that asbestos fibers are not released and notifying the person doing the laundering that the clothing is asbestos-contaminated. The clothing must be transported in properly labeled, sealed, impermeable bags or containers (see 29 CFR 1926.1101 (i)). Although the use of launderable coveralls is allowed by Federal regulations, their use is not recommended. Complete decontamination of cloth is difficult to verify.

It is strongly recommended that employees *do not* wear street or work clothes under the disposable coveralls. The first reason for this is to reduce heat stress, which is often experienced by asbestos workers. The second reason is to reduce the chance that workers' clothes transport contamination to other sites and other people. It is recommended that the workers either wear two disposable coveralls or an appropriate garment, such as slick nylon swimwear, under their disposable suit.

4.3 Decontamination Procedures

Each facility must ensure that all workers perform proper decontamination procedures following all small-scale and/or O&M projects. These procedures may include, but are not limited to:

- Vacuuming - The worker must vacuum the disposable coveralls with a High Efficiency Particulate Air (HEPA) vacuum. If a worker is wearing two suits, he/she uses a HEPA vacuum to decontaminate the outer suit and then removes it. In cases where a worker chooses to wear a slick nylon bathing suit under the disposable clothing, the worker will carefully vacuum off with a HEPA filtered vacuum and remove the disposable suit.
- Showering - The worker will proceed to a shower to further decontaminate, if required, and/or to a clean room to change into street clothing.
- Disposal - In all cases, the worker will dispose of the coveralls and gloves as asbestos-contaminated waste.
- Respirator Care - The last item a worker will remove is the respirator. Respirators are decontaminated as follows:
 - ◇ Wipe off respirator with a damp cloth prior to removal
 - ◇ Loosen straps and exhale as the respirator is removed
 - ◇ Soak filters and dispose of as asbestos-contaminated waste
 - ◇ Wash, dry, reassemble, and store the respirator

5.0 MEDICAL SURVEILLANCE

Medical surveillance is required under the OSHA Construction Standard (29 CFR 1926.1101(m)) for employees working with ACBM when:

- They are exposed at or above the action level (0.1 f/cc) for 30 or more days per year, or
- They are required to wear negative-pressure respirators.

To determine the need for medical surveillance for employees, each facility must conduct an ongoing program of air monitoring. This is to produce sufficient objective data to determine whether employees are exposed at or above the action level.

Each facility ensures that employees participate in a Medical Surveillance Program (MSP) under the situations below:

- If an employee is handling ACBM;
- If an employee, regardless of their job, meets the criteria specified by the Asbestos Construction Standard as described above; and
- If an employee, regardless of their job, meets the criteria specified by the Asbestos General Industry Standard (29 CFR 1910.1001(l)).

If an employee in the asbestos MSP terminates employment for any reason, a final medical exam will be made available within thirty (30) days of termination. No termination exam is needed if the employee has completed an asbestos examination within the previous six months. Medical surveillance shall be conducted in compliance with relevant federal, state, and local laws.

The following is an example of a written MSP which may be used to ensure compliance with the OSHA regulations, and which must be maintained on the site where the asbestos-related O&M work takes place.

MEDICAL SURVEILLANCE PROGRAM

The MSP for KSD consists of the following main elements:

- Initial Examination
- Annual Examination
- Termination Examination
- Signed Opinion by Physician
- Employee Medical Record

A. Initial Examination

As required in the OSHA Regulations (29 CFR 1926.1101 and 1910.1001), all employees who will be assigned to an occupation exposed to airborne asbestos must have an initial examination performed by a licensed physician.

A copy of the physician approval for occupational respirator use will be maintained on the jobsite and a copy of the medical exam will be given to the employee. All medical records will be filed and stored in a safe place for a minimum of 30 years.

B. Annual Examination

All employees who may be exposed to airborne asbestos shall undergo an annual medical examination, which will be the same as the initial examination, except for the OSHA questionnaire and the X-rays. The OSHA questionnaire will be the abbreviated form for use with annual examinations and the X-rays will be given every five years, except for those employees with 10+ years into the asbestos latency period and 35 to 45 years of age. This X-ray will be given every 2 years. All employees over 45 years of age must have an X-ray annually.

	<u>Years Since 1st Exposure</u>	<u>15 - 35</u>	<u>Age of Employee 35 - 45</u>	<u>45+</u>
Frequency of X-rays	0 - 10 10+	every 5 yrs every 5 yrs	every 5 yrs every 2 yrs	every 5 yrs annually

The annual signed physician's opinion on fitness for work in a respirator in an asbestos environment will be maintained on the jobsite and a copy of the annual medical exam will be forwarded to the employee. All medical documentation will be stored and kept for a minimum of 30 years.

C. Termination Examination

As per the OSHA Standard (29 CFR 1910.1001(l)(4)(i) and (ii)), KSD will provide or make available a termination of employment medical examination for any employee who has been exposed to asbestos. The medical examination will be in accordance with the requirements of the periodic or annual medical examination and will be given, or made available, within 30 calendar days before or after the date of termination of employment.

D. Information Provided to Physician

KSD will provide the following information to the examining physician:

1. A copy of the OSHA Regulation 29 CFR 1926.1101 and Appendices D, E, and I.
2. A description of the employee's duties, as they relate to asbestos exposure.
3. The employee's anticipated exposure level.
4. A description of any personal protective and respiratory equipment used.
5. Information from previous medical examinations not otherwise available to the physician.
6. Instructions to the physician not to reveal, in the written opinion given to the employer, specific findings or diagnoses unrelated to occupational exposure to asbestos, without a signed consent form from the employee.

A copy of this information will be maintained in the company files and a reference to this information will be included in the medical file on each employee.

E. Physician's Written Opinion

KSD will establish, as a part of its permanent records, a medical surveillance record on each employee. This record will be maintained for the duration of the employment, plus a minimum of 30 years. This record will be made available, upon written request, to OSHA, the affected employee, and former employees or their designated representatives. The employee medical record shall contain at least the following information:

1. The name and social security number of the employee.
2. A copy of the employee's medical examination results, including the medical history questionnaire responses, results of any tests and physician's recommendations.
3. Any employee medical complaints related to asbestos exposure.
4. A copy or reference to the information provided to the physician by the employer.

Physician Information

This information is for compliance with the OSHA Standard 29 CFR 1926.1101(m)(3) and is to be used as a reference for all medical surveillance exams conducted for KSD.

1. The employee's duties shall be to work with ACBM in an asbestos abatement setting. Various job descriptions are: work area preparation, work inside the contaminated area (encapsulation, enclosure, removal), loading, transporting, and unloading of ACBM.
2. The employee's anticipated exposure level range will be from a trace (.001 f/cc) to an anticipated maximum of 10 f/cc. This exposure will vary with the tasks performed, but will mainly be below the TWA of 0.1 f/cc.
3. The PPE furnished to the employee shall be a respirator, full body covering with disposable coveralls, latex gloves and rubber boots. Hard hats will be issued when applicable. The respirator system used shall be National Institute for Occupational Safety and Health (NIOSH) approved for the work and will be well within the limits of the OSHA protection factor chart. The minimum respirator protection usually furnished by KSD is a powered air-purifying respirator (PAPR), which automatically and continually forces air into the facepiece through no effort of the employee and has the benefit of the positive pressure protection.

According to Federal Regulation 29 CFR 1926.1101(m)(4)(ii), the physician is not to reveal in the written opinion given to the employer specific findings or diagnoses unrelated to occupation exposure to asbestos.

6.0 NOTIFICATION PROCEDURES

A notification program informs employees, students, and outside contractors about the presence of ACBM in the facility. It shows the steps to take to avoid disturbing ACBM. It also informs employees about what to do and whom to contact in case of an asbestos-related emergency.

Notification of employees, students, and outside contractors can be done through letters and/or the posting of warning signs and labels. Warning signs and labels can be attached directly to ACBM or posted to alert people to a hazard prior to entering an area. It is suggested that new employees receive this information during employee orientation. "Awareness" sessions similar to those discussed in Section 3 of this manual can also be used.

Each facility shall also inform short-term workers and outside contractors who may come in contact with ACBM about the presence of ACBM in the facility in which they are working. This step is necessary to avoid the disturbance of ACBM during contracted activities.

6.1 Notification Letters

Each facility provides notification that complies with relevant federal, state, and local laws. Employees and students receive notification containing the details below:

- Presence and location of asbestos in their facility
- Content, location, and availability of the Asbestos Inspection Report and O&M Program
- Health hazards associated with exposure to airborne asbestos fibers
- Types of actions that could result in the release of asbestos fibers
- Name, location, and phone number of the APM, or designee, in the event of damage or disturbance of ACBM

All contractors and short-term workers, including the telephone company, repair and utility workers, and exterminators, shall be notified of the presence of ACBM in the facility. Upon request, the specific location of ACBM in the areas where contractors and short-term workers are working is given along with instructions not to disturb any ACBM. The APM, or designee, is consulted prior to any disturbance of ACBM. The *Contractor Notification Form*, or equivalent form, and the *Short-Term Worker Notification Form*, or equivalent form, stating that they have been informed of ACBM, should be signed by the contractor and short-term workers.

Each facility instructs the appropriate contractor that no ACBM may be installed without prior written approval of the APM, or designee. The contractor signs a statement certifying that the products they used and/or installed are non-ACM. A *Non-ACM Certification Form*, or equivalent form, shall be signed by each contractor prior to installing products within the facility. This information will save subsequent testing and sampling prior to future maintenance, renovation, and demolition projects that affect this material.

6.2 Warning Signs

Warning signs shall be posted, as required by OSHA, any time the fiber contamination level in an area exceeds or can reasonably be expected to exceed the PEL. To comply with this requirement, each facility also posts warning signs in each area during O&M activities involving ACBM. O&M activities include initial cleaning, repair, small-scale removal, and emergency response cleanup, regardless of the fiber contamination level.

Warning signs shall comply with all relevant federal, state, and local laws and must bear the following information:

**DANGER
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTIVE CLOTHING ARE REQUIRED IN THIS AREA**

In cases where warning signs are posted because of fiber contamination levels, each facility documents:

- The location of warning signs,
- The extent of the contamination,
- The length of time the signs were posted,
- The corrective action taken to reduce contamination levels, and
- Proof of the response action's effectiveness (i.e., air samples).

6.3 Warning Labels

Each facility should post warning labels on all mechanical systems insulation that contains asbestos. In addition, all asbestos-containing materials in routine mechanical spaces should be labeled:

**DANGER
CONTAINS ASBESTOS FIBERS
AVOID CREATING DUST
CANCER AND LUNG DISEASE HAZARD**

All labels shall be clearly visible. Labels shall be posted at the beginning and end of each continuous pipe run and at least every 75 feet. Extra labels should be required at each valve, flange, or change in direction. Each time a pipe passes through a wall, floor, or ceiling a label shall be posted on each side of the penetration.

7.0 ACBM SURVEILLANCE AND REINSPECTION PROGRAM

An important aspect of the O&M Program is visual monitoring of ACBM, done at set intervals. The purpose of the monitoring is to detect damaged or deteriorated ACBM as early as possible so that corrective action can be taken.

Custodial and maintenance personnel are instructed to observe the condition of ACBM in their area. They are also instructed to report any damaged to their supervisor and the APM, or designee, as soon as possible.

7.1 Periodic Surveillance

Although no formal training is required by regulatory agencies, it is recommended that person(s) conducting the periodic surveillance activities receive training and experience beyond the general awareness training. This may include EPA Building Inspector/Management Planner accreditation and training on interpreting the facility's Asbestos Inspection Report.

Periodic surveillance documents the condition of all ACBM by using a *Periodic Surveillance Form*. A copy of the form is submitted to the APM, or designee. The periodic surveillance should be done at least every 6 months. This may vary depending on such factors as accessibility, area use, and type of ACBM present.

Schools covered by AHERA are subject to special surveillance programs. The APM, or designee, should consult 40 CFR 763.92(b) for more details.

7.2 Reinspection

A complete reinspection of known ACBM in the facility by an accredited Building Inspector/Management Planner should be accomplished every 3 years, and the O&M Program updated at that time. This reinspection is necessary to keep the O&M Program updated as to any response actions, which may have occurred, and to address any change in the condition of ACBM, or use of the functional space, which contains the ACBM, which may indicate a new hazard in the facility.

In February 1992, EPA published a useful checklist guide for reinspections titled "A Guide To Performing Reinspection Under The Asbestos Hazard Emergency Response Act (AHERA)" (EPA 700/B-92/001).

8.0 EXPOSURE MONITORING

Air monitoring can be a useful tool to further evaluate the condition of ACBM and its potential to release asbestos fibers. Air sampling, when done correctly, may provide early warning about any deterioration of ACBM. To be meaningful, air monitoring is done over a long period of time throughout the entire building under normal use conditions.

8.1 Periodic Area Monitoring

Periodic air monitoring in a building is merely a supplement to an ACBM surveillance program. Each facility conducts periodic air monitoring in buildings with friable ACBM found in air plenums, in areas of significant air movement, and in areas with significant vibration.

Air sampling is strongly recommended on a regular basis, appropriate for the specific conditions as referenced above. The samples must be analyzed using Transmission Electron Microscopy (TEM).

8.2 Employee Exposure Monitoring

Each facility should provide an employee exposure monitoring plan to comply with relevant federal, state, and local laws. Although OSHA allows the use of objective data (see 29 CFR 1926.1101(f)) in place of actual employee air monitoring, air monitoring of employees should be done in order to better design work practices which not only protect the employee from exposure, but also protect the facility from potential contamination. The documentation which this air monitoring generates should be preserved in the permanent record in order to protect the facility owner from any future liability. Air monitoring data should be current within 12 months if it is to be used to verify a negative exposure assessment.

9.0 WORK PERMIT SYSTEM

Each facility shall implement a “work permit” program to control maintenance, renovation, and remodeling work that could result in the disturbance of ACBM. It is also recommended that a “work permit” program be designed to control other asbestos-related activities. A sample program is outlined below. If the facility contracts for asbestos-related activities, this task could be included in the bid specification and/or contract documents. The APM, or designee, may choose another person to assist in implementation and coordination.

The “work permit” system requires any person doing work impacting building materials in the facility to submit a *Job Request Form*, or equivalent form, to the APM, or designee, prior to doing any work. This form would identify the specific personnel who do the work, including outside contractors, and would describe:

- The time and location of the job in question,
- The type of job, and
- Any known information about the presence of ACBM.

Once the APM, or designee, receives the Job Request Form, the steps below are taken:

- Review data - Review the Asbestos Inspection Report and any other records to determine whether or not any ACBM will be affected by the project. If ACBM is unlikely to be disturbed, the APM, or designee, will note the presence of ACBM on the form. The APM, or designee, will instruct the proper people not to disturb the ACBM and the steps to take in the unlikely event of a disturbance.
- Visit the site - Make a site visit of the proposed work if it is determined that ACBM is present and likely to be disturbed. The site visit is done by the APM, or designee.
- Plan work practices - Comply with the O&M Program and all relevant federal, state, and local laws to minimize disturbance of ACBM. If not found in the O&M Program Manual, document the work practices to be used and add them to the O&M Program. New procedures must comply with all aspects of the O&M Program and relevant laws.
- Record information - Use a *Maintenance Work Authorization Form*, or equivalent form, and send to the proper personnel. Provide a copy to any outside contractor involved in the work.
- Revisit the work site - Visit the work site during the project. Document any observation on an *Evaluation of Work Form*, or equivalent form. Record and report changes from approved work practices and the corrective actions taken.
- Filing - Place a copy of the forms listed above in the permanent files.

This work permit system is the key to avoiding accidental exposure to workers or contamination of the facility. It is therefore essential that the APM have the authority to enforce the program.

10.0 RECORD KEEPING

The purpose of record keeping is to document information regarding each facility's O&M activities. A well-maintained and organized system of record keeping will demonstrate that the health and safety of those working or visiting each facility was not compromised.

A benefit of a comprehensive, organized record keeping program is that renovation of a facility is easier because of historical documentation. Also, the complex legal issues involved with asbestos make record keeping especially important.

Each facility should keep the following, or equivalent, records:

Activity	Records
O&M work done by outside contractors	Copy of training documents Copy of RPP Copy of MSP Final Clearance Documentation
Notification of Occupants	Copy of Notification Letter
Notification to Short-Term Workers	Short-Term Notification Record
Training	General Awareness Training Small-Scale Asbestos Worker Training Respirator Training Hazard Communication Training
Medical Surveillance	Initial Questionnaire Periodic Questionnaire Medical Exam Record Physician's Written Opinion Name and SSN of employee Employee complaint, re-exposure Copy of information to Physician

Operations and Maintenance Program Manual

Kyrene Middle School, KSD

FM Project 08-145

Activity	Records
Respiratory Protection	Copy of Training Program Respirator Inspection Form Fit-Test Record Copy of Respirator Protection Program
Periodic Surveillance	Periodic Surveillance Record
Reinspections	Reinspection Record and Report
O&M Activities	Job Request Form Job Authorization Form Visual Inspection Report Notification to Regulators
Emergencies	Emergency Record
Fiber Release Episodes	Fiber Release Record
Transportation of Waste	Chain of Custody Form Dump Receipts Hazardous Waste Manifest Proof of Class "C" Drivers License

Each facility also keeps records of all major abatement operations. These include enclosure, encapsulation, and removal. These records may be supplied by the asbestos consultant and/or the abatement contractor. The records below are kept as part of abatement records:

- Contract documents including specifications, Request for Proposal (RFP), and scope of work;
- Abatement contractor qualifications;
- Abatement contractor submittals, including those specified in contract documents;
- Asbestos consultant qualifications;
- Asbestos laboratory qualifications including Quality Assurance/Quality Control (QA/QC) plans;
- Results of all air samples;
- Photographs;
- Log books;
- Laboratory QA/QC records; and
- Final reports from consultant.

Operations and Maintenance Program Manual

Kyrene Middle School, KSD

FM Project 08-145

The APM, or designee, is responsible for keeping records. The APM, or designee, may need the assistance of clerical and maintenance staff to fulfill record-keeping duties. At a minimum, record keeping must meet relevant federal, state, and local laws.

Record	Retention
Medical surveillance	Employment + 30 years
Air sampling/employee exposure monitoring	Employment + 30 years
Training	Employment + 30 years (recommended)
Respiratory protection (inspections, fit-tests, and training)	Employment + 30 years
All other records	Employment + 30 years

Schools covered by AHERA are subject to additional record keeping requirements. The APM, or designee, should consult 40 CFR 763.94 for more information.

II. GENERAL O&M WORK PRACTICES

1.0 INTRODUCTION

Work practices in each of the three areas addressed in this section should be specific to the ACBM located in the facility, and to the functional spaces (room/area), which contain the ACBM.

2.0 SPECIAL CLEANING

All initial and periodic or additional cleaning of areas containing friable or damaged ACBM must be done with wet methods, HEPA vacuums, steam cleaners or a combination of those methods. The training program should impress on the maintenance and custodial staff the importance of *never* using conventional vacuums to clean up asbestos contaminated debris, and *never* dry sweep or dust in contaminated environments. Initial cleaning should be done in protective coveralls and respirators, with proper decontamination procedures being followed upon completion. All waste or debris should be treated as asbestos and properly disposed of. For regulatory guidance, see AHERA 40 CFR 763.91(c) and OSHA 29 CFR 1926.1101(g)(10) and (l).

These special cleaning procedures will also apply to any clean-up after an accidental fiber release episode.

3.0 EMERGENCY RESPONSE

An accidental contamination or "fiber release episode" may be addressed in one or two ways, depending on the size of the episode. For small or "minor" fiber release episodes (i.e., the falling or dislodging of 3 square or linear feet or less of friable ACBM), the custodial or maintenance people trained in the 16-hour O&M procedures may address clean-up in the following manner:

1. Turn off the HVAC system in the area.
2. Thoroughly saturate the debris.
3. Clean the area using the methods mentioned in 2.0 above.
4. Dispose of all debris as asbestos.
5. Immediately repair the damage to the ACBM.

For larger or "major" fiber release episodes (i.e., the falling or dislodging of more than 3 square or linear feet), the custodial or maintenance people trained in the 16-hour O&M procedures may only:

1. Restrict entry in the area and post signs.
2. Turn off the HVAC system.
3. Contact the accredited outside contractor or in-house emergency response team.

The clean-up of a major fiber release episode should include all the planning, special work practices (see OSHA 29 CFR 1926.1101), final clearance documentation, and record keeping of a major asbestos abatement project.

4.0 MAINTENANCE WORK PRACTICES

The user of this document should be familiar with all the major federal requirements for conducting asbestos related maintenance work (OSHA 29 CFR 1926.1101(g)(9); AHERA 40 CFR 763, Subpart E, Appendix B; National Emissions Standard for Hazardous Air Pollutants (NESHAP) 40 CFR 61.145 and 61.150 where applicable), and design his work procedures within the intent of these rules and guidelines. If more stringent safeguards are needed to protect workers and the facility, they should be researched and implemented.

An enormous amount of this research specific to O&M work procedures has already been completed by a panel of over 100 experts under the guidance of the National Institute of Building Sciences (NIBS). NIBS has produced a "Guidance Manual, Asbestos Operations and Maintenance Work Practices" which details approximately 125 O&M work procedures step by step. Also included are sections on APM and asbestos worker procedures preparatory to these work procedures. To duplicate any of this work here would be redundant and probably inadequate, as the work procedures must necessarily be specific to both the ACBM being addressed and the exposure element involved.

The APM is urged to obtain a copy of the NIBS guide and use it in the design and execution of the work to be addressed at each particular site. NIBS may be contacted at: National Institute of Building Sciences, 1201 L Street, N.W., Suite 400, Washington, DC 20005, or by telephone at (202) 289-7800.

5.0 DISPOSAL/STORAGE REQUIREMENTS

The following section explains the federal requirements for storage and disposal of asbestos-containing waste. Please consult with the state and local regulatory agencies if more stringent requirements apply.

5.1 Generator Requirements

The term "Generator" refers to the owner or operator of the facility or the owner or operator of the demolition/renovation operator or both. The generator is legally responsible and liable for the proper handling, storage and disposal of all ACBM abated from the building(s) and/or property. Refer to the NESHAP requirements at 40 CFR 61.150 for the federal requirements.

5.2 Handling of Asbestos Waste

The generator must discharge no visible emissions during collection, processing, packaging, or transportation of the waste. To accomplish this requirement, the generator must adequately wet the waste material, and seal it while wet in leak tight containers or wrapping. The containers must be labeled with the following 3 labels:

(OSHA)

**DANGER
CONTAINS ASBESTOS FIBERS
CANCER AND LUNG DISEASE HAZARD
AVOID BREATHING AIRBORNE ASBESTOS FIBERS**

(DOT)

**RQ ASBESTOS
NA - 2212**

(EPA)

Name and Address of Generator

Although not specified by federal law, 6-mil poly bags are normally used where applicable as a minimal level of compliance.

5.3 Disposal

All asbestos-containing waste should be deposited as soon as is practical at a waste site approved by the state NESHAP agency. Vehicles used to transport the waste must be marked during the loading and unloading with the following sign:

**DANGER
ASBESTOS DUST HAZARD
CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY**

5.4 On-Site Storage

In some instances the generator cannot arrange for prompt off-site transportation of the asbestos waste. Also, it may not be economically feasible for a generator to provide transportation until substantial waste has been generated. However, there may be local regulations which govern how long the waste may be stored on-site. The limit for storing waste on-site in most states is 6 months to one year beginning on the date the asbestos waste is generated. It is advisable, but not required, to place the disposal bags in impermeable containers (i.e., steel, fiberboard, or fiberglass drums). The date of generation shall be marked on the outside of the containers. If the storage vessels are also designated for disposal, the appropriate labels must be affixed to the outside of the container.

5.5 Waste Shipment Record

A "Waste Shipment Record" must be sent with the waste transporter to the disposal site, containing the following information.

1. Work site name and address
2. Owner's name and address
3. Contractors name and address
4. Waste disposal site name, address and location
5. NESHAP authority for work site (name and address)
6. NESHAP authority for disposal site (name and address)
7. Description of materials (DOT)
8. Amount of waste shipped
9. Bill of lading information
10. Alternate waste site
11. Emergency response telephone number

12. Contractors certification
13. Transporter name, address and telephone number
14. Discrepancy noted at waste site
15. Waste site receipt of materials

If a signed copy is not received back from the disposal site within 35 days, the transporter, and/or disposal site must be contacted for information. If the signed copy is then not received back within 45 days of shipment, the local or regional EPA must be contacted in writing. All waste shipment records must be retained for at least 2 years. An example of a waste shipment records form and instructions is provided at the end of this section.

6.0 COST ESTIMATES OF CLEANING EQUIPMENT

The list below includes enough equipment for small-scale abatement jobs. Most facilities will not need this much equipment and, therefore, much of this equipment is optional. This section will not be applicable to facilities, which do not have an in-house program for small-scale abatement.

One Time Purchase	Character	Costs
HEPA vacuum	12 gallon, w/1.5" attachments	760.00 w/tools
Full-face respirator	NORTH or MSA	141.00
Half-face respirator	NORTH or MSA	18.00
Personal monitor kit	8-hrs. at max capacity	285.00
Mister - hand held	quart	1.50
Mister - with tank	3 gallon	35.00
Caution signs (plastic)	12 or more (10 x 14")	3.85
Extension cord	100 feet, 12/3 cord	32.00
Ground fault circuit interrupter		29.50
Nylon brushes		3.20 each

Disposable Materials/ Cleaning Supplies	Character	Costs
Filters: HEPA vacuum	12 gallon capacity	160.00
Paper vacuum	microfilter	7.50
HEPA respirator		2.60 each
Vacuum bags	6-mil poly, 33x50, 75/box	34.65
Wet wipe cloths	20 x 40" case of 300	N/C
Muslin	10 square yards	N/C
Cheese cloth	10 square yards	N/C
Latex gloves		.85 pair
5 micron water pump filter		3.50 each

Operations and Maintenance Program Manual

Kyrene Middle School, KSD

FM Project 08-145

Abatement Supplies	Character	Costs
Surfactant	5 gallons	45.00
Encapsulant: lag kote	5 gallons	40.72
lag kloth	5 gallon	75.50
Duct tape	2" case of 24	78.00
Protective disposable clothing w/hooded, zipping type booties	case of 25	36.00
6-mil polyethylene plastic bags	30x40, case of 100	41.50
Polyethylene	620c	34.50
Glove bags	44 x 60" case of 25	101.00
Razor knives		2.05 each
Wire saws		4.50 each
Scrapers		various prices
Wire cutters		12.50
Chisel rock hammer	1	20.00
Cotton canvas gloves		.75 pair
